

Dear Client,

EFFECTIVE FEBRUARY 4, 2015, TriCore Reference Laboratories is moving from a 6-color to a 10-color flow cytometry technology. This advanced technology improves accuracy in population identification, allows for simultaneous screening for a greater variety of hematopoietic neoplasms, and advances our flow cytometry service in the following areas:

- Improves diagnosis and monitoring of patients with leukemia and lymphoma.
- Provides more complex characterization of various cell populations.
- Improves evaluation of small samples, such as fine needle aspirate specimens and body fluids, with the ability to interrogate a greater number of characteristics per cell.
- Increases antibody coverage in panels.
- Reduces the need for additional tubes in many cases for faster turnaround times.
- Enhances reports with concise, easy to read results.

To learn more about the 10-color flow cytometry service, contact your TriCore Account Executive.

Thank you for your business. We look forward to our continued partnership.

Sincerely,

TriCore Reference Laboratories
